

Creating the Canadian Cordillera

Fifty years ago this show would not have been possible. In those days we thought that the Rockies popped up out of a “geosyncline,” and we had no reasonable explanation for the weird rock making up the mountains to the west. Now we know! And the story is fascinating. Ben presents it in a way anyone can understand, no geological background required. Slides, rock specimens, free handout notes. Bring your questions about any aspect of the earth sciences.
